

HR901-20 Advances in Crop Protection

20/21

Department

Life Sciences

Level

Taught Postgraduate Level

Module leader

John Clarkson

Credit value

20

Module duration

3 weeks

Assessment

100% coursework

Study location

University of Warwick main campus, Coventry

Description

Introductory description

This module aims to teach students the importance and impact of plant pests, diseases and weeds on food production and provide them with a thorough understanding of their biology and ecology.

[Module web page](#)

Module aims

This knowledge will underpin an examination of the principles behind the wide range of different control approaches that can be applied and an analysis of how these may be combined in an integrated crop management system. The conflicting requirements of environmental and crop protection will also be addressed.

Outline syllabus

This is an indicative module outline only to give an indication of the sort of topics that may be covered. Actual sessions held may differ.

Causes of disease; types of plant pathogens Biology and ecology of pests, pathogens and weeds
Plant pathogen infection processes Introduction to molecular biology and application in plant

pathology Plant pathogen detection and discrimination Plant population dynamics Chemical control measures for pests, diseases and weeds Biological control of pests, diseases and weeds Monitoring and forecasting of pests and diseases Plant genetics and resistance to pests and diseases Resistance management Components of integrated crop pest and disease management systems

Learning outcomes

By the end of the module, students should be able to:

- Demonstrate understanding of the impact of plant pests, diseases and weeds on food production and global food security
- Demonstrate understanding and have knowledge of the key concepts and mechanisms associated with the biology and ecology of plant pathogens, pests and weeds and how these relate to different control strategies.
- Have knowledge of and critically assess the range of advanced approaches for controlling pests, diseases and weeds.
- Develop and evaluate the components of integrated crop pest and disease management systems and how these interact with economics, legislation and the environment.
- Demonstrate understanding, knowledge and practice independently the experimental techniques in plant pathology, entomology and weed science

Subject specific skills

To understand the impact of plant pests, diseases and weeds on food production. To understand key concepts associated with the biology and ecology of plant pathogens, pests and weeds. To assess a range of advanced approaches for controlling pests, diseases and weeds. To develop and evaluate the components of integrated crop pest and disease management systems. To analyse the conflicting and complex requirements of environmental and crop protection.

Transferable skills

Analysis and evaluation

Study

Study time

Type	Required
Lectures	29 sessions of 1 hour (12%)
Seminars	12 sessions of 1 hour (5%)
Practical classes	2 sessions of 6 hours (5%)
Private study	147 hours (59%)
Assessment	50 hours (20%)
Total	250 hours

Private study description

Independent research

Costs

No further costs have been identified for this module.

Assessment

You do not need to pass all assessment components to pass the module.

Assessment group A4

	Weighting	Study time
Assessed Essay	60%	30 hours
In-module test	40%	20 hours
1 hour		

Feedback on assessment

Written feedback released through Moodle.

Availability

Courses

This module is Core for:

- THRA-D4A3 Postgraduate Taught Food Security
 - Year 1 of D4A3 Food Security
 - Year 1 of D4A3 Food Security
- Year 1 of THRA-D4A2 Postgraduate Taught Sustainable Crop Production: Agronomy for the 21st Century

This module is Optional for:

- Year 1 of ULFA-C1A1 Undergraduate Biological Sciences (MBio)
