## Description

### Introductory description

ES191-15 Electrical and Electronic Circuits

[Module web page](#)

### Module aims

To present, in context, the fundamental concepts of circuits, devices and systems that underpin all branches of Engineering. Students will study fundamental circuit analysis techniques including nodal analysis, mesh analysis, Thevenin circuits as well as transient analysis applied to 1st and 2nd order circuits. Students will study fundamental mathematical operations of DC and AC quantities including phasors, vectors and complex numbers. Students will also study basic electronic components (like diodes, transistors, operational amplifiers and filters) that make up more complex electrical and electronic circuitry.

### Outline syllabus

This is an indicative module outline only to give an indication of the sort of topics that may be

covered. Actual sessions held may differ.

DC circuit analysis (Nodal, Mesh, Thevenin, Norton, Superposition etc) ,

AC Circuit Analysis (Vectors, Reactance, Impedance etc)

Circuit Techniques for Transients (1st and 2nd order)

AC Power

Introduction to Electricity and Magnetism

Diodes and transistors

Operational amplifiers

Analogue amplifiers and circuits

Basic digital electronics

Active and passive filters (RC filters, op-amp filters etc)

## Learning outcomes

By the end of the module, students should be able to:

- Understand basic principles in electrical and electronic circuits.
- Appreciate fundamental aspects of electronic component operation.
- Make appropriate assumptions to simplify and thus model real-life electrical and electronic components
- Calculate and measure circuit parameters.
