

# CS2D1-30 Software Engineering

**22/23**

**Department**

Computer Science

**Level**

Undergraduate Level 2

**Module leader**

Andrew Hague

**Credit value**

30

**Module duration**

10 weeks

**Assessment**

100% coursework

**Study location**

University of Warwick main campus, Coventry

---

## Description

### Introductory description

This module will allow students to understand the importance of the software life cycle, including a range of software development methodologies, and to design object oriented software with the aid of a formal system modelling notation. They will gain experience with software tools that support development, e.g. source control systems and test frameworks, and through this come to understand the practical challenges with the development of a significant software system. Ultimately, they will critically evaluate their experience of practical software development with regards to project management, software processes, and technical accomplishment.

### Module aims

The module aims to provide students with knowledge of techniques used for managing and delivering software in industry. The module will cover the full software development life cycle from gathering requirements at the start through to organising the development tasks and finally consideration for releasing the software developed.

### Outline syllabus

This is an indicative module outline only to give an indication of the sort of topics that may be covered. Actual sessions held may differ.

In this module, students will learn:

- Object oriented modelling and design: objects, classes, inheritance, aggregation, and composition
- Formal notation for expression issues related to the analysis, design, and implementation of systems
- Classical software engineering principles, including life cycles, cost estimation, testing, and maintenance
- Human computer interaction: human information processing models and memory, learning and skill acquisition, interaction styles, and accessibility
- Techniques for eliciting user requirements
- Architectural design and implementation: technology selection, application of design patterns, and frameworks for system design
- Levels of system and performance testing: unit, integration, system, and user/acceptance testing

## **Learning outcomes**

By the end of the module, students should be able to:

- Describe the importance of stages in the software life cycle including a range of software methodologies.
- Design object oriented software with the aid of a formal modelling notation.
- Understand principles of user interface design.
- Critically evaluate their experience of practical software development with regard to project management, software processes, and technical achievement.

## **Indicative reading list**

Sommerville, I., "Software Engineering (9/e)", Pearson (2010)

Pressman, RS, "Software Engineering: A practitioners Approach (8/e)", McGraw Hill (2014)

## **Subject specific skills**

- Critically analyse a business domain in order to identify the role of information systems
- Highlight issues and identify opportunities for improvement through evaluating information systems in relation to their intended purpose and effectiveness
- Analyse business and technical requirements to select and specify analyses business and technical requirements to select and specify appropriate technology solutions
- Design, implement, test and debug software to meet requirements using contemporary methods including agile development
- Configure and deploy solutions to end users
- Follow a systematic methodology for initiating, planning, executing, controlling, and closing technology solutions projects
- Apply industry standard processes, methods, techniques and tools to execute projects
- Contemporary techniques for design, developing, testing, correcting, deploying and documenting software systems from specifications, using agreed standards and tools

- How teams work effectively to produce technology solutions
- Common vulnerabilities in computer networks including unsecure coding and unprotected networks
- How to deliver a technology solutions project accurately consistent with business needs.
- The fundamentals of data structures, database system design, implementation and maintenance

## Transferable skills

- Able to give and receive feedback constructively and incorporate it into his/her own development and lifelong learning
  - Applies analytical and critical thinking skills to Technology Solutions development and to systematically analyse and apply structured problem solving techniques to complex systems and situations
  - Have demonstrated that they have mastered basic business disciplines, ethics and courtesies, demonstrating timeliness and focus when faced with distractions and the ability to complete tasks to a deadline with high quality.
  - Flexible attitude
  - Ability to perform under pressure
  - A thorough approach to work
  - Logical thinking and creative approach to problem solving
- 

## Study

### Study time

Type	Required
Lectures	40 sessions of 1 hour (13%)
Tutorials	14 sessions of 1 hour (5%)
Practical classes	35 sessions of 1 hour (12%)
Work-based learning	186 sessions of 1 hour (62%)
Other activity	25 hours (8%)
Total	300 hours

### Private study description

No private study requirements defined for this module.

### Other activity description

Self study

## Costs

No further costs have been identified for this module.

---

## Assessment

You do not need to pass all assessment components to pass the module.

### Assessment group A1

	<b>Weighting</b>	<b>Study time</b>
Work-based project report	80%	
Presentation relating to work-based project	20%	

### Feedback on assessment

Written feedback will be provided for the report and presentation

---

## Availability

### Courses

This module is Core for:

- Year 2 of DCSA-I112 Undergraduate Computer Science and Technology Solutions (Data Analyst) (Degree Apprenticeship)
