## Description

### Introductory description

Medical research has produced major advances in surgical techniques and methods of treatment that help to prolong life and reduce disease, but it has extended its role into the assessment of disease and the facilitation of treatment. This module examines the role law now plays in attempting to regulate these processes, and how ethical principles are applied to medical decisions.

### Module aims

Medical research has produced major advances in surgical techniques and methods of treatment that help to prolong life and reduce disease. These advances in medicine have also been accompanied by extensive experimentation with human life. The medical profession has extended its concerns beyond its original base of performing surgery and prescribing drugs for organic illness into new roles such as the assessment of mental illness and alcoholism, the supervision of the process of giving birth, facilitating contraception, sterilisation, abortion and genetical screening etc. New technology has drawn the medical profession into the processes of augmenting fertility and embryo experimentation as well as extending life itself with intensive care treatment. One purpose of this module is to examine these developments and the role law now plays in attempting to regulate these processes. While the doctor/patient contractual relationship may now

be inadequate and in many cases irrelevant, it is clear that the legal relationships produced by new forms of statutory and common law regulation do not always offer adequate protection for the consumers of medical services. In many areas there is an issue whether a new legal framework should be provided for significant medical decisions.

Finally, the module also includes an examination of how ethical principles are applied to medical decisions and the extent to which such principles are incorporated into the legal standards applied to medical decisions.
