WM3B3-24 Low Level Tools and Techniques for Cyber Security

23/24

Department
WMG
Level
Undergraduate Level 3
Module leader
Christo Panchev
Credit value
24
Module duration
30 weeks
Assessment
100% coursework
Study location
University of Warwick main campus, Coventry

Description

Introductory description

Modern programming approaches use high level constructs which abstract away the system's architecture. These high levels of abstraction use code generation programs such as compilers and assemblers to take the human author's input, and produce code that will execute as output. The modern programmer rarely needs to consider the underlying architecture of the machine that will execute the code.
There are situations where, rather than creating an executable from source, you need to go in the opposite direction; you need to infer what the source code might look like by analysing the executable. Perhaps you have some potential malware; or perhaps you perhaps you have to analyse and exploit a vulnerability which an executable might have. Either way, you want to know what the program will do, were it to run on your system.
In order to reverse engineer an executable, you need to understand the typical idioms that an operating system, architecture and code generation programs will adopt to convert high level constructs into low level executables.
In addition, if the executable is malware, then it is likely the authors will have used some obfuscation in order to make the analysis more difficult. Under these circumstances you need to understand the typical idioms of obfuscation.

Module aims

The module aims to explore the essential low-level techniques and analysis concepts relevant to identifying malicious code and exploiting vulnerabilities that reside in the binaries.

Outline syllabus

This is an indicative module outline only to give an indication of the sort of topics that may be covered. Actual sessions held may differ.

The content of this module will be taught from a cyber security perspective.

- executable code from a variety of perspectives
- assembly language programming
- machine-level instruction set and organisation
- code generation
- reverse engineering techniques
- de-obfuscation
- common tools for reverse engineering
- anti-debugging mechanisms
- fuzzing

Learning outcomes

By the end of the module, students should be able to:

- Identify common idioms and patterns used during code transformation and explain the origin and organisation of arbitrary code and/or data fragments within an executable program.
- Apply tools and techniques as appropriate to infer the executable's overall high-level function, potentially obfuscated, potentially malicious code.
- To perform malicious code analysis, vulnerability identification and evaluation independently from the findings generated by automated analysis tools.

Subject specific skills

1 - Identify common idioms and patterns used during code transformation and so explain the origin and organisation of arbitrary code and / or data fragments within an executable program.

2 - Apply tools and techniques as appropriate to infer the overall high level function of executable, potentially obfuscated, potentially malicious code.

Transferable skills

Critical thinking, problem solving

Study

Study time

Type	Required
Supervised practical classes	18 sessions of 3 hours (26%)
Private study	91 hours (43%)
Assessment	65 hours (31%)
Total	210 hours

Private study description

One third of independent study time will not directly contribute to assessment
Two thirds of independent study time will contribute to assessment
Lecture time falls within workshop time

Costs

No further costs have been identified for this module.

Assessment

You do not need to pass all assessment components to pass the module.

Assessment group A3

Assessment component	Weighting	Study time	Eligible for self-certification
Develop detailed reverse engineering and analysis report for a given scenario	60%	40 hours	Yes (extension)

	Weighting	Study time	Eligible for self-certification

Students are expected to produce an individual report with detailed reverse engineering, malware analysis, and evaluation outcome for a given scenario.

Reassessment component is the same

Assessment component

Develop detailed vulnerability research and development report for a given scenario	40%	25 hours	Yes (extension)

Students are expected to produce an individual report with detailed vulnerability analysis and exploit development for a given scenario.

Reassessment component is the same

Feedback on assessment

Verbal feedback during tutorial sessions
Summative feedback on assignments

Availability

Courses

This module is Core for:

- Year 3 of UWMA-H651 Undergraduate Cyber Security
