

ES2E3-15 Digital Systems Design

26/27

Department

School of Engineering

Level

Undergraduate Level 2

Module leader

Adam Khonat

Credit value

15

Module duration

10 weeks

Assessment

100% coursework

Study location

University of Warwick main campus, Coventry

Description

Introductory description

To introduce students to the principles and practice of designing digital electronic circuits.

[Module web page](#)

Module aims

Focus on field programmable gate array implementation, including the tool flow, architecture, testing, and design for performance.

Outline syllabus

This is an indicative module outline only to give an indication of the sort of topics that may be covered. Actual sessions held may differ.

Basic C: Types, operators, loops, pointers, bitwise operations. Data Representation: Binary numbers, unsigned and signed integers, fixed and floating point, codes.

Logic and Digital Arithmetic: Basic function truth tables, multiplexers, encoders, decoders, half and full adders, multipliers, comparators and division, sequential circuits – latches, flip flops, finite state machines.

Instruction Set Architecture: Assembly language, machine instructions including register, immediate, and jump, addressing modes, program flow, timers, interrupts.

Processor Microarchitecture: Memory, ALU, program counter, register file, control unit, single-cycle and pipelined processors.

I/O examples: UART, PWM.

Microcontroller Programming: Loops, interrupts, timers, accessing peripherals. A/D and D/A converters, interfacing to sensors.

Recap of combinational and sequential circuits: gates, multiplexers, encoders, decoders, latches, D flip-flop, registers, shift registers.

Design with hardware description languages: (Verilog) module definitions, gate-level circuits, assign statements, behavioural combinational descriptions, behavioural synchronous descriptions.

Design flow and FPGA architecture: basic circuit synthesis, FPGA logic blocks, hard blocks, I/O, mapping to FPGA blocks, placement and routing, configuring FPGAs.

Testing digital circuits: basic Verilog testbenches, self-checking testbenches, file I/O for input/output vectors, testing strategies.

Arithmetic circuits: limits of ripple adders, carry-lookahead adders, multipliers, fixed-point data representation and resulting errors, floating point circuit complexity.

Timing and pipelining: basic combinational timing characteristics, timing of synchronous components, computing circuit timing performance, pipelining for improved performance, hazards, race conditions, and metastability.

Processors and I/O: basic structure of a processor and how this relates to performance, integrating peripherals over UART, SPI, I2C, and faster serial standards, computing data rates for these standards.

Learning outcomes

By the end of the module, students should be able to:

- Understand the theory of combinational and sequential circuits and how these combine in the design of digital computing circuits through the use of the Verilog hardware description language (HDL).
- Assess the digital design flow as currently practised professionally in industry, with reference to field programmable gate arrays, and at a more general level, to custom application specific integrated circuits.
- Examine how mathematics is performed in custom circuits, and how simple units can be combined to implement compute datapaths.
- Develop a testing strategy and design a testbench to evaluate the functional correctness of a circuit using the testing features of the Verilog HDL and a professional standard simulator.
- Discuss the performance of synchronous digital circuits, based on the timing of basic components, and how pipelining affects performance, and how this differs from measuring the performance of software running on processors.
- Function effectively as an individual, and as a member or leader of a team. Evaluate effectiveness of own and team performance.

Subject specific skills

Plan and manage the design process, including cost drivers, evaluating outcomes, and working with technical uncertainty.

Ability to apply relevant practical and laboratory skills.

Ability to conceive, make and realise a component, product, system or process.

Transferable skills

Numeracy: apply mathematical and computational methods to communicate parameters, model and optimize solutions.

Apply problem-solving skills, information retrieval, and the effective use of general IT facilities.

Communicate (written and oral; to technical and non-technical audiences) and work with others.

Plan self-learning and improve performance, as the foundation for lifelong learning/CPD.

Exercise initiative and personal responsibility, including time management, which may be as a team member or leader.

Overcome difficulties by employing skills, knowledge and understanding in a flexible manner.

Study

Study time

Type	Required
Lectures	20 sessions of 1 hour (13%)
Practical classes	7 sessions of 2 hours (9%)
Other activity	2 hours (1%)
Private study	114 hours (76%)
Total	150 hours

Private study description

Guided independent learning: 114 hrs

Other activity description

Revision classes: 2 x 1 hr

Costs

No further costs have been identified for this module.

Assessment

You must pass all assessment components to pass the module.

Assessment group A

	Weighting	Study time	Eligible for self-certification
Assessment component			
Group Design Assignment	80%		No
Assessed Design Assignment to design and implement a digital circuit using the skills learned in the course (16 pages report & video).			
Reassessment component			
Individual Design Assignment			Yes (extension)
Assessed Design Assignment to design and implement a digital circuit using the skills learned in the course (10 pages report & video).			
Assessment component			
Individual Contribution Report	20%		Yes (extension)
Each student shall submit a 2 page summary of their contributions and reflections on the project.			
Reassessment component is the same			

Feedback on assessment

Detailed marking on assessed design exercise.
Model solutions are published for past examination papers
Cohort level feedback on examinations

Availability

Pre-requisites

To take this module, you must have passed:

- All of
 - [CS132-15 Computer Organisation & Architecture](#)

Courses

This module is Core for:

- Year 2 of UCSA-G404 Undergraduate Computer Systems Engineering
- UCSA-G406 Undergraduate Computer Systems Engineering
 - Year 2 of G406 Computer Systems Engineering
 - Year 2 of G406 Computer Systems Engineering
- Year 2 of UCSA-G408 Undergraduate Computer Systems Engineering
- Year 2 of UCSA-G405 Undergraduate Computer Systems Engineering (with Intercalated Year)
- Year 2 of UCSA-G407 Undergraduate Computer Systems Engineering (with Intercalated Year)
- Year 2 of UCSA-G409 Undergraduate Computer Systems Engineering (with Intercalated Year)
