Description

Introductory description

The lectures will provide a solid background in the mathematical description of fluid dynamics. They will cover the derivation of the conservation laws (mass, momentum, energy) that describe the dynamics of fluids and their application to a remarkable range of phenomena including water waves, sound propagation, atmospheric dynamics and aerodynamics. The focus will be on deriving approximate expressions using (usually) known mathematical techniques that yield analytic (as opposed to computational) solutions.

Module aims

An important aim of the module is to provide an appreciation of the complexities and beauty of fluid motion. This will be highlighted in class using videos of the phenomena under consideration (usually available on YouTube).

- - be able to understand the derivation of the equations of fluid dynamics
- - master a range of mathematical techniques that enable the approximate solution to the aforementioned equations
- - be able to interpret the meanings of these solutions in 'real life' problems
